

(a) Shared crossing

Fixed paths share one cell.

(b) Reserve the shared cell

Binary occupancy of the crossing

	$t = 0$	$t = 1$	$t = 2$	$t = 3$
$r_A(t)$	0	1	0	0
$r_B(t)$	0	0	1	0

At most one robot in the crossing

$$r_A(t) + r_B(t) \leq 1$$

1 = occupies the shared cell; 0 = elsewhere.

(c) One-step wait resolves the conflict

Illustrative route graph and discrete schedule; no measured performance.
